

?????????LED?????(blinking LED).

???heartbeat LED, ???RAID HBA???????

The D2 LED on the 8708ELP is the heartbeat LED. If the controller is functioning normally, the heartbeat LED should be blinking. If the heartbeat LED is completely off or solid red, it generally means that the controller is in an error condition.

Some examples of conditions which can cause a solid red heartbeat LED:

- The processor is frozen.
- A firmware flash did not complete prior to powering down.
