RTP ports and Docker

Way 1

Docker cannot deal with a wide range of UDP ports being forwarded. One way to get around this is to run the container on a machine that is not using 10000-20000 UDP and start the container with `--network=host`. The downside is that a container started in this way cannot communicate on any of the docker networks.

Way 2

?? rtp.conf ??? RTP Port ???????

“ ?? trunk providers ??????????????

rpt.conf

```
[general]
rtpstart = 10000
rtpend   = 10099
```
