n2n VPN

Introduction

n2n ?????????????? EasyTier?????????

[n2n](#) is a layer-two **peer-to-peer** virtual private network (VPN) which allows users to exploit features typical of P2P applications at network instead of application level. This means that users can gain native IP visibility (e.g. two PCs belonging to the same n2n network can ping each other) and be reachable with the same network IP address regardless of the network where they currently belong. In a nutshell, as OpenVPN moved SSL from application (e.g. used to implement the https protocol) to network protocol, n2n moves P2P from application to network level.

In order to start using n2n, two elements are required:

- A *supernode*: it allows edge nodes to announce and discover other nodes. It must have a port publicly accessible on internet.
- *edge nodes*: the nodes which will be a part of the virtual networks

A virtual network shared between multiple edge nodes in n2n is called a *community*. A single supernode can relay multiple communities and a single computer can be part of multiple communities at the same time. An encryption key can be used by the edge nodes to encrypt the packets within their community.

n2n tries to establish a direct peer-to-peer connection via udp between the edge nodes when possible. When this is not possible (usually due to special NAT devices), the supernode is also used to relay the packets.

Installation

Download: <https://github.com/ntop/n2n>

Ubuntu/Debian

```
sudo dpkg -i n2n_3.0.0-1038_amd64.deb
sudo apt install -f
```

Usage

One-liner command in foreground.

```
# On Linux, change the community, encrypt key and tun IP to your own
# edge -c <community> -k <encrypt key> -a <tun IP address> -l <supernode host:port> -f
sudo edge -c my-community -k my-secret -a 10.9.9.10 -l n2n.lucktu.com:10090 -f
```

Run as service in background.

```
# Generate the config file
sudo cp /etc/n2n/edge.conf.sample /etc/n2n/edge.conf

# Start the edge
sudo systemctl start edge
sudo systemctl enable edge
```

Supernode

```
sudo supernode -p 10090
```

FreeLAN

Introduction

[Freelan](#) is a free, open-source, multi-platform, peer-to-peer VPN software that abstracts a LAN over the Internet. It works on Windows, Linux and Mac OSX.

Whether you want to connect the computers of your family, play an old LAN-only game with your friends, or give a privileged access to your private network to your collaborators, freelan will do the job perfectly.

[FreeLAN](#) is free all-around VPN open-source software for Windows, Linux, and macOS that can be used to create three types of VPN:

- Client-server
- Peer-to-peer
- Hybrid that includes the two types mentioned above.

Installation

Download: <https://www.freelan.org/download.html>

Ubuntu/Debian

```
sudo apt update
sudo apt install freelan
```

Windows

1. [?? Visual C++?](#)
2. [?? freelan-2.2.0-amd64-install.exe?](#)

Usage

One-liner command in foreground.

```
# On PC#1, which is correctly configured to allow access to the 12000/UDP from the internet.
# By default, the listen port is 12000/UDP and the tun_tap.ip_address is 9.0.0.1
freelan --security.passphrase "my_secret"
```

On PC#2

```
freelan --security.passphrase "my_secret" --tap_adapter.ipv4_address_prefix_length 9.0.0.2/24 --fscp.contact  
<IP-to-PC1>:12000
```

wg-quick

Installation

```
# Ubuntu/Debian
sudo apt install wireguard

# Fedora
sudo dnf -y install wireguard-tools
```

Generate the key pairs

```
sudo -i
cd /etc/wireguard
wg genkey | tee privatekey | wg pubkey > publickey
```

Configure the WireGuard interface on Peer A

`/etc/wireguard/wg0.conf` :

```
cat << EOF > /etc/wireguard/wg0.conf
[Interface]
Address = 10.0.0.2/32
```

```
PrivateKey = XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
DNS = 8.8.8.8, 4.4.4.4

[Peer]
PublicKey = XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
AllowedIPs = 0.0.0.0/0
Endpoint = the.wireguard.server:51820
EOF
```

Up & Down the wg link

```
sudo wg-quick up wg0
sudo wg
sudo journalctl -fu wg-quick@wg0

sudo wg-quick down wg0
```

nmcli

```
# Import the config file
CONF_FILE="wg0.conf"
nmcli connection import type wireguard file "$CONF_FILE"

# Show the profiles
nmcli
nmcli conn show # List all profiles
nmcli conn show <name> # Display the details for specified profile

# Delete the profile
nmcli connection delete wg0

# Modify the profile my-wg0
nmcli connection modify my-wg0 \
    autoconnect yes \
    ipv4.method manual \
    ipv4.addresses 192.168.7.5/24 \
    wireguard.listen-port 50000 \
    ...

# Active/Inactive the interface
```

```
nmcli connection up my-wg0  
nmcli connection down my-wg0
```

Algo VPN

- [Algo VPN](#) is a set of Ansible scripts that simplify the setup of a personal WireGuard and IPsec VPN.

NetBird

- [NetBird](#) combines a configuration-free peer-to-peer private network and a centralized access control system in a single open-source platform

Wiredoor

Wiredoor is a self-hosted, open-source ingress-as-a-service platform that allows you to expose applications and services running in private or local networks to the internet—securely, reliably, and without complex infrastructure.

It uses reverse VPN connections powered by WireGuard and exposes services through a built-in NGINX reverse proxy. Perfect for developers, operators, or teams that want full control of their ingress without relying on public cloud solutions.
